### Alarm Descriptions

Alarm signal operates as Open Collector type and send TTL on signal since C4H10 measured value beyond 25% LEL until it go down to 20% LEL. It is designed to be activated when C4H10 measured value surpass 25% LEL and deactivated down to 20% LEL to avoid unwanted rapid switching by hysteresis effect.

Alarm\_On : 25% LEL, Alarm-Off : 20% LEL

EK-100SL series is available for customer to enable to change alarm activation & deactivation point.

### PWM Descriptions : Option

\*  $\text{Measurement}_{(\text{ppm})} = (t_H - 2\text{msec}) / 1000\text{msec} \times \text{Range}_{(\text{ppm})}$  ( $t_H$  : High Pulse Width)

\*  $\text{Range}_{(\text{ppm})}$  : 0~100% LEL (0~18,000 ppm)

EX)  $t_H$  (High Pulse Width) calculation for 50% LEL in 100% LEL Range.

\*  $\text{Measurement}_{(\% \text{LEL})} = 50\% \text{LEL} = (t_H - 2\text{ms}) / 2,000\text{msec} \times \text{Range}_{(\% \text{LEL})}$  ,

\*  $t_H = 1,000 \text{ msec} \times (50\% \text{LEL} / 100\% \text{LEL}) + 2\text{msec} = 502\text{msec}$

(cf:  $T_L = \text{Period} - t_H = 2,000 \text{ msec} - 502 \text{ msec} = 1,498 \text{ msec.}$ )

### Analog Voltage Output Descriptions : Option

Measured Voltage 0.5V~4.5V match proportionally to 0 ~ 100% LEL.

\*  $\text{C4H10 Measurement}_{(\text{ppm})} = \frac{\text{Output Voltage} - 0.5}{4.5 - 0.5} \text{ Voltage} \times 100\% \text{LEL.}$

EX) if the Output Voltage is 2.5V in 0~100% LEL range,

$\text{C4H10} (\% \text{LEL}) = (2.5 - 0.5) \text{ V} \div (4.5 - 0.5) \text{ V} \times 100\% \text{LEL}$

$= 0.5 \times 100\% \text{LEL} = 50\% \text{LEL}$

※ **Caution**

1. The gold cavity part of the sensor module or the PCB outer part should not touch by the customer's case housing. It causes long-term value fluctuation. Be at least 3 mm apart from the housing.
2. When removing and inserting the sensor module, do not hold the gold cavity but hold the PCB on both sides. Put on the electret gloves to prevent the static electricity.  
(Excessive force on the gold cavity can affect the initial performance and accuracy of the sensor.)  
→ If the measured value is wrong, you can calibrate zero point for more than 10 minutes at CAL1 (MCDL) position and use it with high accuracy.
3. Do not let water get on, drop, or shock the sensor.
4. Do not store the sensors in high temperature and high humidity for long time without applying power. The initial measurement accuracy of the sensor may be affected.
5. Be careful not to be affected by static electricity and induction electromagnetic field around sensor.  
To prevent static electricity from being generated during assembly, wear electrostatic gloves and work on a static-free workbench. (Keep the sensor in the place where the electricity is removed.)
6. Install the sensor at a position as far away as possible from the motor or vibration. Vibration or noise may be accuracy affected during sensor operation.
7. When using the sensor for the first time or after long term storage, you can use 0\_MCDL / 0\_ACDL Zero point calibration and use it with high accuracy.
